Event Access
Basic System – STV2

Any way you need it :

- Mobile by handheld device
- Portable by floor lanes or tripods
- Permanent with full height turnstiles

This STV2 is our simplest Barcode Access System.

This optional system can work as is, without computers or software...
Just plug and play!

How the system works:

1. Tickets are pre printed, each with unique, deferent number in its barcode symbol

2. On entry, the **STV2 Validators** reads the barcode on the ticket by its internal scanner

3. The STV2 verify by itself, in its internal memory that this ticket is good, and that it have not been used before !

4. If all is well, the Validator opens the turnstile or gives green OK signal.

5. Optionally, each Validator can count how many people validated their tickets !

6. In sites with several Validators, they should be synchronized by standard LAN cable.

Note: We also offer more complex systems with real time operation, computers and software...
